ABSTRACT
MUZAKKI, F. A., CHIKMAWATI, T. & HARTANA, A. 2020. The resurrection of Schizostachyum biflorum McClure (Bambusoideae). Reinwardtia 19(2): 93‒96. Based on newly collected specimens from Mount Salak referable to Schizostachyum biflorum, made it justifiable to recognize this species as different from S. iraten, to which formerly it was synonymized. A complete description of S. biflorum, a comparative tabulation of the morphological features that distinguished it from S. iraten, and figures of the two species are presented.

Key words: Bamboo, Java, Schizostachyum biflorum, S. iraten.

INTRODUCTION
In revising the Javanese Schizostachyum, several botanical explorations were conducted to many places. During a trip to Mount Salak (West Java), a collection of Schizostachyum locally called awi buluh (Muzakki FAM 6) was found. Subsequent observations revealed that FAM 6 has all characters of Schizostachyum biflorum described by McClure (1936) based on specimens collected by Blume from Mount Salak. Originally McClure (1936) thought that specimens collected by Blume kept in L was the same species of S. blumei Nees. However, there were some prominent characters which convinced McClure that the Blume specimens kept in L was an undescribed species and named it as S. biflorum McClure, with the type specimens collected by Blume from Mount Salak. Dransfield (1983), considered that the type of S. biflorum McClure did not differ from S. iraten Steud. and considered its synonym.

Therefore it is considered necessary to elaborate further the morphological characters of these two species, whether they are synonymous or should be treated two distinct species.

MATERIALS AND METHODS
Material for this study were based on collection available in Herbarium Bogoriense and specimen image (especially specimen type) from National Herbarium of the Netherlands, Leiden. Morphological analysis were conducted using 36 morphological features elaborated by Clark (2006).

RESULTS AND DISCUSSION
It is interesting to note that in the treatise of Javanese Schizostachyum no reference was made by Monod de Froideville (1968) to S. biflorum McClure. Based on leaf anatomical evidence obtained from living specimens kept in Bogor Botanic Gardens, Prawiroatmodjo (1982) concluded that S. biflorum McClure from Mount Salak differs from S. blumei Nees, S. longispiculatum (Munro) Kurz, S. zollingeri Steud., S. caudatum Backer ex K.Heyne and S. lima (Blanco) Merr., because their characters of prickle hairs, macro hairs and stomata rows were different. Without referring to Prawiroatmodjo (1982), in 1983 Dransfield concluded that S.
biflorum could not be distinguished from S. iraten. The results of further observations on Muzakki FAM 6 showed that there are many morphological characters which indicate that this specimen belongs to S. biflorum. Careful analysis of McClure’s (1936) extensive description and illustration, indicated that Muzakki FAM 6 possessed all characters mentioned, except for the presence of 2-3 lodicules, which McClure failed to observe probably because of fall off.

On the other hand, as shown on Table 1 and Fig. 1, the floret of S. biflorum is 23 mm long with constantly 2 fertile florets and 2-3 lodicules (McClure mentioned lodicule absent), in contrast to those of S. iraten which has a shorter fertile florets (up to 16 mm) and 1-3 fertile florets, also constantly has 2 lodicules. Based on the observation of fresh specimens, it is shown that the culm sheath ligule of S. biflorum is serrate, 2–3 mm with 5 mm bristle, whereas the ligule on S. iraten is denticulate 1 mm with 1–3 mm bristles. The culm sheath auricles inconspicuous in S. biflorum and rim like to slightly rounded in S. iraten. Culm sheath blades of S. biflorum are spreading become reflex when older, whereas the culm sheath blades of S. iraten are erect. Moreover, the culms of S. biflorum are fragile because they has small diameter (2–5–6 cm), with long internodes (60–130 cm) and very thin walls (2–4 mm); whereas the culms of S. iraten has 1–3 cm diameter, 50–100 cm internodes and thicker walls (3–5 mm).

Based on these morphological differences it can be concluded that S. biflorum should be treated as different species from S. iraten, which supports the conclusions of Prawiroatmodjo (1982).

SCHIZOSTACHYUM BIFLORUM McClure, Blumea 2: 89–91 (1936) — Type: INDONESIA, Java, Mount Salak, Blume s.n. (Holotype: L. HLB number 908.84–971).

Young shoot green or whitish green. Culms erect with pendulous apex, 10–12 m tall, straight, green, 2–5(–6) cm diameter by 60–130 cm internodes, walls thick 2–4 mm, with white waxy powder at the node and white hairs at the young culm, girdle as a belt at least 1 mm width. Branch complements subequal, bearing about 2 m from the ground. Culm sheaths up to 15–27 cm long, persistent or tardily caducous, covered with white appressed hairs, sometimes glabrous, margins sparsely ciliate, apex symmetrically concave; auricles inconspicuous, glabrous or sometimes with few bristle at the outer end, 0.5–1 cm long; ligule serrate, 2–3 mm long, extends to near margins, with bristles up to 5 mm; culm sheath blade spreading to reflexed when older, narrowly triangular, linear to lanceolate, 15–30 × 2–3 cm long, usually more than half as long as culm sheath, with white to light brown hairs on the abaxial side, especially at the base. Leaves complements with 6–8 leaves; leaf blades oblong-lanceolate, 14–32 × 1.7–5 cm, abaxial surface pale-puberulent; leaf sheath with

pale white hairs, sometimes glabrous, margin ciliata; auricles inconspicuous with few bristles 5 mm long; ligule serrate, 2–3 mm long, bristles 2–3 mm long; pseudopetiole 5–10 mm long. **Inflorescences** terminal, clustered on leafy flowering branches or leafless branches. **Pseudospikelet** up to 23 mm long, with 2 fertile florets; prophylls 2 mm long, ovate, with 2 equal keels, hairy, apex acute; bracts 2, sometimes 1; the lower bract 4 mm long, ovate, apex acute-obtuse, sometimes split at the tip, glabrous; the higher bract 6 mm long, ovate, apex obtuse, glabrous; rachis 2–3 mm long, glabrous; rachilla segment 6–7 mm long, slightly hairy at the edge; prolongation of the rachilla bristle-like, 10 mm long, slender, glabrous, with a minute rudiment floret; lemma of the lower floret 8.5–11 × 4.5 mm, ovate, apex acute or short mucronate 0.5 mm, slightly hairy in margin apex, 7-nerved, palea 10–13 × 6 mm, ovate, apex bifid (sinus shallow); lemma of the upper floret 11–12 × 5 mm, ovate, apex obtuse long 1 mm, glabrous, 6-nerved, palea 10–12 × 5 mm; floret, ovate, apex bifid (sinus shallow); lodicules 2-3, lanceolate, 3–5 mm; stamens 6, filaments free, anthers 5–6 mm long; Stigmas 3. **Fruit** not seen.

**Habitat.** Primary forest Salak Mountain, around the Curug Nangka waterfalls at elevation ca. 970 m asl.

**Vernacular name.** Awi buluh.

**Specimen examined.** Java, Bogor, Tamansari, Sukajadi, Mount Salak. 17 August 2017. **Muzakki FAM 6 (BO);** Java, Banten, Lebak, Gunung Kencana. 28 January 2020. **Muzakki FAM 55 (BO), sterile.**

**ACKNOWLEDGEMENTS**

We would like to thank Prof. Elizabeth A. Widjaja and Prof. Mien A. Rifai for their guidance and valuable suggestions.

INSTRUCTION TO AUTHORS

Scope. Reinwardtia is a scientific regular journal on plant taxonomy, plant ecology and ethnobotany published in June and December. Manuscript intended for a publication should be written in English.

Titles. Titles should be brief, informative and followed by author’s name and mailing address in one-paragraphed.

Abstract. English abstract followed by Indonesian abstract of not more than 250 words. Keywords should be given below each abstract.

Manuscript. Manuscript is original paper and represent an article which has not been published in any other journal or proceedings. The manuscript of no more than 36 pages by using Times New Roman 11, MS Word for Windows of A4 with double spacing, submitted to the editor through <reinwardtia@mail.lipi.go.id>. New paragraph should be indented in by 5 characters. For the style of presentation, authors should follow the latest issue of Reinwardtia very closely. Author(s) should send the preferred running title of the article submitted. Every manuscript will be sent to two blind reviewers.

Identification key. Taxonomic identification key should be prepared using the aligned couplet type.

Nomenclature. Strict adherence to the International Code of Nomenclature is observed, so that taxonomic and nomenclatural novelties should be clearly shown. English description for new taxon proposed should be provided and the herbaria where the type specimens area deposited should be presented. Name of taxon in taxonomic treatment should be presented in the long form that is name of taxon, author’s name, year of publication, abbreviated journal or book title, volume, number and page.

Map/line drawing illustration/photograph. Map, line drawing illustration, or photograph preferably should be prepared in landscape presentation to occupy two columns. Illustration must be submitted as original art accompanying, but separated from the manuscript. The illustration should be saved in JPG or GIF format at least 350 pixels. Legends or illustration must be submitted separately at the end of the manuscript.

References. Bibliography, list of literature cited or references follow the Harvard system as the following examples.

REINWARDTIA Author Agreement Form

Title of article:

Name of Author(s):

I/We hereby declare that:

- My/Our manuscript was based on my/our original work.
- It was not published or submitted to other journal for publication.
- I/we agree to publish my/our manuscript and the copyright of this article is owned by Reinwardtia.
- We have obtained written permission from copyright owners for any excerpts from copyrighted works that are included and have credited the sources in our article.
